

Step 1.  $xy = 1$   
between  $x = 1/2$   
and  $x = 2$ ;  
original function  
to extend.

Step 2. Extend to  
a closed curve.  
Here I used the  
circle of center  
(2, 2) and radius  
 $3/2$ ; exact choice  
shouldn't matter.  
Maintain convexity  
but ignore  
smoothness.

Step 3. Choose neighborhoods of  $x = 2$  and  $y = 2$   
on which the curve can be regarded as a function  
of  $x$  and  $y$ , respectively.  
(Here it's clearly possible; we need to prove it  
always is.)

Step 4. Choose subneighborhoods of those in Step  
3, still containing  $x = 2$  and  $y = 2$ .

Step 5. Excise portions of the curve corresponding  
to Step 4. Use convolution/Whitney extension/etc.  
on the neighborhoods in Step 3 to replace with  
something smooth and convex.
